

Technology Forecast: Hypothesis

Technology Forecast Hypothesis

My overarching goal is to provide a concise overview of my pilot study on technology forecasting.

The objective of this study is to pinpoint recent technological trends in any given domain or technology.

By conducting a technology landscape intellectual property (IP) analysis of any technology, one can identify gaps or whitespace in the technology.

Similarly, within the patents of that technology, there may be distant-related patents that fall outside the boundaries of the domain. From there, one can extract certain concepts.

When combining these three elements—core technology, whitespace, and concepts from distant-related patents—and inputting them into a Large Language Model (LLM), a nascent technology sector may be identified. It is noteworthy that the generated invention by the LLM can be both nascent and novel at times.

Overview

Concise overview of pilot study on technology forecasting

Objective: To pinpoint recent technological trends in any given domain or technology and identify nascent technology sectors.

Methodology:

- Conduct a technology landscape IP analysis to identify core technology, whitespace, and concepts from distant-related patents.
- Input these elements into an LLM to generate new technology ideas.

Key findings:

- The LLM can generate nascent and novel technology ideas.
- By combining core technology, whitespace, and concepts from distant-related patents, new technology sectors can be identified.

Potential Applications Of The Methodology

- Identifying new technology opportunities
- Developing new technology roadmaps
- Assessing the competitive landscape
- Supporting R&D decision-making

Overall, your pilot study on technology forecasting is a promising approach to identifying recent technological trends and nascent technology sectors. The methodology has the potential to be a valuable tool for businesses, governments, and other organizations that are looking to stay ahead of the curve in technology.
